

Project Evaluation BoF team 17

Project: Birds of a Feather team 17 (Allen Weng)

Reviewer: Zhuoran Li

Code/Repo Smells

Score (1-5): 3

Comments: Code is readable, indentation is good, and comments are tailored to fit the given scenarios from the staff. There's no documentation or stuff like that but that's just because the instructor did not require it.

Application Quality

Score (1-5): 3

Comments: There's no design process in the GitHub but Bill's 110 asks for it separately. The app itself seems functional, the functionality works but I did not test the Bluetooth function because I don't own an Android phone. The UI is clean but it could use a little polishing. The responsiveness is a bit slow but that's due to Android's emulator.

Self Considerations

Score (1-2.5): 2

Comments: Due to the way the staff design the project, things like tools and frameworks are a little bit hard to pick up, but the overall clarity of the code remains intact. This project had shown me how birds of a feather can be implemented differently and are intriguing for me to browse through it.

Other Comments

Overall a good project, everything works as the instructors expected, code is organized and clean.
